SOFTWARE ARCHITECTURE DESIGN

Design how a system works is one of the software architect responsibilities. What do you have to keep in mind?

#1 ITERATIVE PROCESS

It is a process that runs iteratively to finish the software architecture design.

#2 DESIGN COMPONENTS

The Software Architect is reponsible for designing software components.

#3 COMPONENTS VS. PIECE

A software component is like a piece. A system requires the creation, reuse and orchestration of different kinds of pieces like information services in the cloud, data sources, sensors, actuators, etc.

#4 CONNECTED COMPONENTS

The components are interconnected together and make up the software architecture.

YOU ARE GOOD TO DESIGN!

Stay creative
